<ows:Title>Délimitation parcellaire AOC viticole</ows:Title>
<ows:Abstract>Selon les règlements européens n°110/2008 du 15 janvier 2008, n°1151/2012 du 21 novembre 2012 et n°1308/2013 de l’OCM , le cahier des charges des appellations définit l’aire géographique. Le terme de « délimitation parcellaire » désigne une aire qui repose sur les limites administratives du cadastre (les parcelles) et dont le maillage suffisamment fin permet de tenir compte de variations très localisées des éléments du milieu physique. Elle correspond à l'aire de production de la matière première. Elle est incluse dans l'aire géographique. Données produites par l'Institut National des Origines et la Qualité (INAO)</ows:Abstract>

<ows:Title>Conservatoire du littoral : parcelles protégées</ows:Title>
<ows:Abstract>L’intervention foncière du Conservatoire du littoral est plus particulièrement justifiée dans au moins un de ces quatre critères : - Lorsque le terrain fait l’objet de pressions en faveur de l’urbanisation mettant en échec la réglementation existante ou de menaces

d’artificialisation irréversible du milieu ; - Lorsque le terrain connaît un processus de dégradation qui appelle une gestion patrimoniale pour restaurer la biodiversité et les paysages ; - Lorsque le terrain est inaccessible et que son ouverture au public est souhaitable ; - Lorsque la maîtrise foncière permet d’assurer la pérennité d’activités économiques traditionnelles garantes d’un paysage caractéristique ou d’équilibres écologiques remarquables. Ces interventions du Conservatoire répondent à quatre préoccupations : - C’est sur la zone côtière immédiate que les pressions sont les plus fortes ; - Il faut veiller à une répartition équilibrée des acquisitions ; - Certains grands sites nationaux ont une importance particulière, en fonction de critères écologiques, esthétiques et paysagers ; - Ces interventions doivent être appréciées au regard des interactions entre les espaces concernés et leur environnement et donc en termes de fonctionnalité au sein d’une zone plus large et plus complexe sur le plan des écosystèmes.</ows:Abstract>

<ows:Title>Zonage du dispositif Pinel en Bretagne 2020-2021</ows:Title>
<ows:Abstract>La réduction d'impôt « Pinel » (code général des impôts) s'applique à l’investissement locatif réalisé dans les zones où la tension entre l'offre et la demande de logements est la plus forte. La loi n°2019-

1479 du 28 décembre 2019 de finances pour 2020, prévoit à titre expérimental, un dispositif dérogatoire au droit commun pour la Bretagne. Ainsi, les communes ou parties de communes éligibles à la réduction d'impôt « Pinel » sont fixées par arrêté du préfet de région. Cet arrêté est pris après avis du président du conseil régional et du comité régional de l'habitat et de l'hébergement. Cet article prévoit également que le préfet de région fixe, par arrêté, les plafonds de loyer et de ressources du locataire pour chaque commune ou partie de commune éligible et par type de logement. L'une des particularités de cette expérimentation réside dans l'éligibilité du dispositif qui peut être limitée à une partie seulement du territoire communal. Lorsqu'une commune n'est éligible que pour une partie de son territoire, deux approches sont distinguées, à savoir à la maille de l'IRIS (correspondant à un quartier) ou à la maille du carreau de 200 mètres sur 200 mètres.</ows:Abstract>

<ows:Title>Carroyage DFCI</ows:Title>
<ows:Abstract>Le « carroyage DFCI » est un système de maillage géographique utilisé en France par les acteurs de la Défense des Forêts Contre les Incendies (DFCI). Le territoire métropolitain est couvert par des carrés de 100 km de côté, identifiables par deux lettres. Chaque carré de 100 km est divisé en 25 carrés de 20 km de côté, numérotés par des chiffres pairs de 0 à 8. Chaque carré de 20 km est divisé en 100 carrés de 2 km de côté, numérotés par un groupe composé d'une lettre et d'un chiffre. L'unité élémentaire est un carreau de 2 kilomètres de côté, défini par 6 caractères (exemple : KD42F7). Pour désigner un point à l'intérieur de l'unité élémentaire, la précision est obtenue en découpant ce carré en cinq zones numérotées de 1 à 5. Il a été créé sur une grille qui s'appuie sur la projection Lambert II étendue. Depuis 2009, il est re-projeté en Lambert 93 avec une légère déformation des angles et des surfaces. Carroyage DFCI (2 km) : Chaque carré de 20 km est divisé en 100 carrés de 2 km de côté, numérotés par un groupe composé d'une lettre et d'un chiffre. Les carrés de 2 km sont dénommés de A à L (sauf I et J) pour les abscisses, et numérotés de 0 à 9 pour les ordonnées. Date des données : 7 juin 2016 Source : couches 100, 50, 20 et 2 km : Entente Valablre - PôNT, couche 1 km : avec l'aimable autorisation de Geonov (www.geonov.fr)</ows:Abstract>

<ows:Title>Ortho 20 cm</ows:Title>
<ows:Abstract>Le produit BD ORTHO® V3 est une collection de mosaïques d'orthophotographies numériques en couleurs ou en Infra Rouge couleurs, rectifiées dans la projection adaptée au territoire couvert. La BD ORTHO® V3 se compose d'images numériques (sans habillage ni surcharge) et d'indications de géoréférencement. Le contenu informationnel permet localement une utilisation jusqu'au 1 :2,000ième pour mettre en valeur le territoire, enrichir la visualisation des données et des projets. Date de prise de vue aérienne disponible via cet url: https://data.geopf.fr/annexes/ressources/fiches/photographies-aeriennes-RVB/geoportail_dates_des_prises_de_vues_aeriennes-RVB.pdf</ows:Abstract>

<ows:Title>Indicateurs nationaux Nature en Ville</ows:Title>
<ows:Abstract>Une base de données recensant les superficies d’espaces verts urbains et de couverts arborés urbains pour les communes les plus denses et peuplées de France (hexagone + DROM). Les indicateurs fournis couvrent deux millésimes : le millésime M1 2017-2020 et le millésime M2 2021-2023. ; édition 2017-2023</ows:Abstract>

<ows:Title>ORTHO MIXTE Aérien / Satellite</ows:Title>
<ows:Abstract>Ce jeu de données est constitué de 2 orthoimages aux alentour de la ville de Gap. Une orthoimage issu de la BD Ortho®, possédant donc les mêmes spécifications (https://geoservices.ign.fr/bdortho). Une seconde orthoimage issue des images Pléiades Néo à 30 cm de résolution. Concernant les images Pléiades Néo, un traitement en réflectance par image est réalisé puis une égalisation radiométrique et une rehausse des couleurs sur la totalité des images sont ensuite appliqués. Les traitements subi par l'orthoimage Pléiades Néo pour sa constitution sont les mêmes sur tous les jeux de données.</ows:Abstract>

<ows:Title>ORTHO MIXTE Aérien / Satellite Express</ows:Title>
<ows:Abstract>Ce jeu de données Ortho-Express est constitué d’une orthoimage composée d’images aériennes dans la limite du département des Alpes-de-Haute-Provence (04) et d’images Pléiades Néo dans la limite du département des Hautes-Alpes (05). Ce prototype d’orthoimage multi-sources est proposé sous une forme brute c’est à dire n’ayant reçu que des traitements automatiques. La partie aérienne du jeu de données est ainsi constitué de l’Ortho-Express Vraie (https://geoservices.ign.fr/orthovraie), la partie spatiale est quant à elle constituée de l’orthoimage Pléiades Néo re-échantillonnée à 20 cm. Le mosaïquage entre les 2 source est défini par la limite départementale sans retouche. Aucun traitement d’égalisation radiométrique n’a été appliqué pour homogénéiser les 2 sources de données. L’orthoimage est accompagnée du graphe de mosaiquage entre les 2 sources de données.</ows:Abstract>

<ows:Title>Plan IGN HD</ows:Title>
<ows:Abstract>Le plan IGN HD cartographie les paysages à grande échelle de façon tres détaillée en intégrant au fonds de carte la richesse des informations issus des données LiDAR HD et d’occupation du sol issu des données COSIA. Cette version est dédiée à la mise en avant des éléments du paysages au dessus du sol, comme la végétation, les bâtiments et leurs ombres portées.</ows:Abstract>

<ows:Title>Les sols dominants de France métropolitaine – Carte harmonisée</ows:Title>
<ows:Abstract>Les Référentiels Régionaux Pédologiques (RRP) sont une représentation des sols à l’échelle du 1/250 000, réalisés par département ou par région dans le cadre du programme Inventaire, Gestion et Conservation des Sols (IGCS) coordonné par le Groupement d’intérêt scientifique sur les Sols ou Gis Sol. Il s’agit de l’information pédologique cartographique la plus précise actuellement disponible sur la totalité du territoire de France métropolitaine. Cartographier les sols à l’échelle du 1/250 000 consiste à délimiter la portion de la couverture pédologique qui présente des caractéristiques communes en termes de paysage et de répartition des sols. Ces ensembles cohérents sont alors appelés Unités Cartographiques de Sols (UCS). A cette échelle de représentation, chacune des plages cartographiques ou UCS est caractérisée par un ou plusieurs types de sol différents, nommés Unités Typologiques de Sol (UTS). Le pourcentage surfacique de chaque UTS a été estimé au sein de chaque UCS, et les noms de sols ont été décrits suivant le Référentiel Pédologique français (Baize et al., 2008 - https://www.afes.fr/referentiel-pedologique). Les RRP sont constitués d’une carte associée à une base de données sémantiques décrivant de manière exhaustive les UCS et les UTS du territoire concerné. Cette base de données est structurée selon un format national : Donesol. La présente carte est issue de l’harmonisation de l’ensemble des RRP au niveau des limites administratives pour aboutir au RRP harmonisé national par l’unité Info&Sols d’INRAE. Les données par territoire (régional ou départemental) peuvent être obtenues auprès des gestionnaires locaux des RRP.</ows:Abstract>

<ows:Title>CORINE Land Cover - Changements 1990-2000</ows:Title>
<ows:Abstract>Inventaire biophysique du changement d'occupation des sols entre 1990 et 2000 suivant la nomenclature CORINE Land Cover en 44 postes. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et plus généralement de l'aménagement de l'espace. La base des changements CORINE Land Cover 1990-2000, a été réalisée à partir de CLC 1990 et de CLC 2000.</ows:Abstract>

<ows:Title>CORINE Land Cover - DOM - Changements 2000-2006</ows:Title>
<ows:Abstract>Inventaire biophysique du changement d'occupation des sols entre 2000 et 2006 suivant la nomenclature CORINE Land Cover en 50 postes. CORINE Land Cover est une base de données d'occupation des sols produite dans le cadre du programme européen d'observation de la Terre Copernicus. Cet inventaire biophysique de l'occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l'écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et de l'aménagement de l'espace. La base des changements CORINE Land Cover DOM 2000-2006 a été réalisée à partir d'images satellitaires des périodes 1998-2003 et 2005-2008, et de données d'appui.</ows:Abstract>

<ows:Title>CORINE Land Cover - France métropolitaine - Changements 2006-2012</ows:Title>
<ows:Abstract>Inventaire biophysique du changement d'occupation des sols entre 2006 et 2012 suivant la nomenclature CORINE Land Cover en 44 postes. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil

de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et plus généralement de l'aménagement de l'espace. La base des changements CORINE Land Cover 2006-2012, a été réalisée à partir d'images satellitaires des années 2006 et 2012 et de données d'appui.</ows:Abstract>

<ows:Title>CORINE Land Cover - France métropolitaine - Changements 2012-
2018</ows:Title>
<ows:Abstract>Inventaire biophysique du changement d'occupation des sols
entre 2012 et 2018 suivant la nomenclature CORINE Land Cover en 44 postes.
CORINE Land Cover est une base de données d’occupation des sols produite
dans le cadre du programme européen d’observation de la Terre Copernicus.
Cet inventaire biophysique de l’occupation des terres fournit une
information géographique de référence pour 39 États européens. La
continuité du programme et la diffusion des données CORINE Land Cover sont
pilotées par l'Agence européenne pour l'environnement. Le producteur pour
la France est le Service de la donnée et des études statistiques du
ministère chargé de l’écologie. L'utilisation de cette base de données
permet des applications variées adaptées aux problématiques de
l'environnement et à celles de l'aménagement du territoire : production
cartographique, exploitation à des fins statistiques ou bien encore
analyses géographiques en combinaison avec d'autres bases de données. Outil
de connaissance et d'analyse, CORINE Land Cover apporte également une aide
à la décision comme instrument de suivi, de surveillance et de gestion de
l'environnement, des milieux naturels et plus généralement de l'aménagement
de l'espace. La base des changements CORINE Land Cover 2012-2018, a été
réalisée à partir d'images satellitaires des années 2011-2012 et 2017 et de
données d'appui.</ows:Abstract>

<ows:Title>CORINE Land Cover - DOM - 2000</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 2000 en 50 postes. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et de l'aménagement de l'espace. La base de données CORINE Land Cover DOM 2000 a été réalisée à partir de CORINE Land Cover DOM 2006 et de la base des changements 2000-2006.</ows:Abstract>

<ows:Title>CORINE Land Cover - 2006 révisée</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 2006 en 44 postes pour la métropole et 50 postes pour les DOM. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et plus généralement de l'aménagement de l'espace. La base de données CORINE Land Cover 2006 révisée, dite CLC 2006 révisée, est une correction de CLC 2006 réalisée à partir d'images satellitaires de l'année 2006 pour la

métropole, d'images satellitaires prises entre 2005 et 2008 pour les DOM et de données d'appui.</ows:Abstract>

<ows:Title>CORINE Land Cover - France métropolitaine - 2006</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 2006 en 44 postes. CORINE Land Cover est une base de données d'occupation des sols produite dans le cadre du programme européen d'observation de la Terre Copernicus. Cet inventaire biophysique de l'occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l'écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et plus généralement de l'aménagement de l'espace. La base de données CORINE Land Cover 2006, dite CLC 2006, a été réalisée à partir de CLC 2000 révisée et de la base des changements 2000-2006.</ows:Abstract>

<ows:Title>CORINE Land Cover - DOM - 2012 révisée</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 2012 en 50 postes. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour

la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et de l'aménagement de l'espace. La base de données CORINE Land Cover 2012 révisée, dite CLC 2012 révisée, est une correction de CLC 2012 réalisée à partir d'images satellitaires prises entre 2011 et 2012 et de données d'appui.</ows:Abstract>

<ows:Title>CORINE Land Cover - 2018</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 2018 en 50
postes pour les DOM et 44 postes pour la Métropole. CORINE Land Cover est
une base de données d’occupation des sols produite dans le cadre du
programme européen d’observation de la Terre Copernicus. Cet inventaire
biophysique de l’occupation des terres fournit une information géographique
de référence pour 39 États européens. La continuité du programme et la
diffusion des données CORINE Land Cover sont pilotées par l'Agence
européenne pour l'environnement. Le producteur pour la France est le
Service de la donnée et des études statistiques du ministère chargé de
l’écologie. L'utilisation de cette base de données permet des applications
variées adaptées aux problématiques de l'environnement et à celles de
l'aménagement du territoire : production cartographique, exploitation à des
fins statistiques ou bien encore analyses géographiques en combinaison avec
d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land
Cover apporte également une aide à la décision comme instrument de suivi,
de surveillance et de gestion de l'environnement, des milieux naturels et
de l'aménagement de l'espace. La base de données CORINE Land Cover 2018 a
été réalisée à partir de CORINE Land Cover 2012 révisée et de la base des
changements 2012-2018.</ows:Abstract>

<ows:Title>CORINE Land Cover - 1990</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 1990 en 44
postes. CORINE Land Cover est une base de données d’occupation des sols
produite dans le cadre du programme européen d’observation de la Terre
Copernicus. Cet inventaire biophysique de l’occupation des terres fournit
une information géographique de référence pour 39 États européens. La
continuité du programme et la diffusion des données CORINE Land Cover sont
pilotées par l'Agence européenne pour l'environnement. Le producteur pour
la France est le Service de la donnée et des études statistiques du
ministère chargé de l’écologie. L'utilisation de cette base de données
permet des applications variées adaptées aux problématiques de
l'environnement et à celles de l'aménagement du territoire : production
cartographique, exploitation à des fins statistiques ou bien encore
analyses géographiques en combinaison avec d'autres bases de données. Outil
de connaissance et d'analyse, CORINE Land Cover apporte également une aide
à la décision comme instrument de suivi, de surveillance et de gestion de
l'environnement, des milieux naturels et plus généralement de l'aménagement
de l'espace. La base de données CORINE Land Cover 1990, dite CLC 1990, a
été réalisée à partir d'images satellitaires de l'année 1990 et de données
d'appui.</ows:Abstract>

<ows:Title>Raster CORINE Land Cover - 2000</ows:Title>
<ows:Abstract>Raster au pas de 25m de l'inventaire biophysique de
l'occupation des sols en 2000 en 44 postes pour la Métropole, 50 postes

pour les DOM. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et de l'aménagement de l'espace. La base de données CORINE Land Cover DOM 2000 a été réalisée à partir de CORINE Land Cover DOM 2006 et de la base des changements 2000-2006 pour les DOM, et à partir d'images satellitaires de l'année 2000 et de données d'appui pour la Métropole. </ows:Abstract>

<ows:Title>Raster CORINE Land Cover - DOM - 2000</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 2000 en 44 postes sur la métropole et 50 sur les DOMs CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme

européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et plus généralement de l'aménagement de l'espace. La base de données CORINE Land Cover 2000, dite CLC 2000, a été réalisée à partir d'images satellitaires de l'année 2000 et de données d'appuis</ows:Abstract>

<ows:Title>Raster CORINE Land Cover - DOM - 2006 - révisée</ows:Title>
<ows:Abstract>Inventaire biophysique de l'occupation des sols en 2006 en 44 postes pour la Métropole et 50 postes pour les DOM. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et plus généralement de l'aménagement de l'espace. La base de données CORINE Land Cover 2006 révisée, dite CLC 2006 révisée, est une correction de CLC

2006 réalisée à partir d'images satellitaires de l'année 2006 pour la Métropole, d'images satellitaires prises entre 2005 et 2008 pour les DOM et de données d'appui.</ows:Abstract>

<ows:Title>Raster CORINE Land Cover - 2012</ows:Title>
<ows:Abstract>Raster au pas de 25m de l'inventaire biophysique de l'occupation des sols en 2012 en 44 postes pour la Métropole, 50 postes pour les DOM. CORINE Land Cover est une base de données d’occupation des sols produite dans le cadre du programme européen d’observation de la Terre Copernicus. Cet inventaire biophysique de l’occupation des terres fournit une information géographique de référence pour 39 États européens. La continuité du programme et la diffusion des données CORINE Land Cover sont pilotées par l'Agence européenne pour l'environnement. Le producteur pour la France est le Service de la donnée et des études statistiques du ministère chargé de l’écologie. L'utilisation de cette base de données permet des applications variées adaptées aux problématiques de l'environnement et à celles de l'aménagement du territoire : production cartographique, exploitation à des fins statistiques ou bien encore analyses géographiques en combinaison avec d'autres bases de données. Outil de connaissance et d'analyse, CORINE Land Cover apporte également une aide à la décision comme instrument de suivi, de surveillance et de gestion de l'environnement, des milieux naturels et de l'aménagement de l'espace. La base de données CORINE Land Cover 2012, dite CLC 2012, a été réalisée à partir de CORINE Land Cover 2006 révisée et de la base des changements 2006-2012. </ows:Abstract>

<ows:Title>Raster CORINE Land Cover - Couche haute résolution du type de forêts - Résolution 20m - 2012</ows:Title>
<ows:Abstract>Les couches haute résolution sont des couches thématiques d’occupation des sols, produites par le service Territoire du programme européen d'observation de la Terre Copernicus. Ce programme est coordonné par la Commission européenne et associe l’Agence spatiale européenne,

l’Agence européenne pour l’environnement ainsi que les États membres. Ces données sont produites automatiquement à partir d’images satellite. Elles sont ensuite vérifiées puis améliorées manuellement. La production et la diffusion de ces couches haute résolution sont pilotées par l'Agence européenne pour l'environnement. Pour la France, le Service de l'observation et des statistiques du ministère chargé de l'environnement a la responsabilité des vérifications et des améliorations de ces produits. Le type de forêt cartographie la distinction feuillus ou résineux majoritairement présents dans les pixels, avec un taux de couvert arboré de plus de 10%. Ce produit permet d’approcher le plus possible des forêts au sens de la définition de l’Organisation des Nations unies pour l'alimentation et l'agriculture (FAO). La surface minimale cartographiée est de 0,52 ha, ce qui correspond à un groupement de 13 pixels. Les valeurs cartographiées sont : - 0 : Zone non-arborée - 1 : Feuillus - 2 : Conifères - 254 : Inclassable (nuage, donnée satellite indisponible, ombre ou neige) - 255 : En dehors de la zone d'étude Ces données haute résolution peuvent être utilisées indépendamment ou en complément de CORINE Land Cover. En effet, CLC permet de cartographier des polygones homogènes d’occupation des sols tels que du tissu urbain discontinu et des zones industrielles ou commerciales. Les couches haute résolution permettent alors d’apporter une nouvelle information pour chacune de ces zones, en précisant leur degré d’imperméabilisation, leur taux de couvert arboré, etc. </ows:Abstract>

<ows:Title>Raster CORINE Land Cover - Couche haute résolution du taux d'imperméabilisation des sols - Résolution 20m - 2012</ows:Title>
<ows:Abstract> Les couches haute résolution sont des couches thématiques d’occupation des sols, produites par le service Territoire du programme européen d'observation de la Terre Copernicus. Ce programme est coordonné par la Commission européenne et associe l’Agence spatiale européenne, l’Agence européenne pour l’environnement ainsi que les États membres. Ces données sont produites automatiquement à partir d’images satellite. Elles sont ensuite vérifiées puis améliorées manuellement. La production et la diffusion de ces couches haute résolution sont pilotées par l'Agence européenne pour l'environnement. Pour la France, le Service de l'observation et des statistiques du ministère chargé de l'environnement a la responsabilité des vérifications et des améliorations de ces produits. Le taux d’imperméabilisation des sols cartographie le pourcentage des sols imperméabilisés par pixels de 20 m de côté. Le revêtement des sols imperméabilisés, issu de l’artificialisation des terres, est maintenu en général sur de longues périodes. La surface minimale cartographiée est de 20 m x 20 m. Les valeurs cartographiées sont : - 0 : Zone non-imperméable - 1-100 : Taux d'imperméabilisation - 254 : Inclassable (nuage, donnée satellite indisponible, ombre ou neige) - 255 : En dehors de la zone d'étude Ces données haute résolution peuvent être utilisées indépendamment ou en complément de CORINE Land Cover. En effet, CLC permet de

cartographier des polygones homogènes d’occupation des sols tels que du tissu urbain discontinu et des zones industrielles ou commerciales. Les couches haute résolution permettent alors d’apporter une nouvelle information pour chacune de ces zones, en précisant leur degré d’imperméabilisation, leur taux de couvert arboré, etc.</ows:Abstract>

<ows:Title>Raster CORINE Land Cover - Couche haute résolution du taux d'imperméabilisation des sols - Résolution 20m - 2015</ows:Title>
<ows:Abstract>Les couches haute résolution sont des couches thématiques d’occupation des sols, produites par le service Territoire du programme européen d'observation de la Terre Copernicus. Ce programme est coordonné par la Commission européenne et associe l’Agence spatiale européenne, l’Agence européenne pour l’environnement ainsi que les États membres. Ces données sont produites automatiquement à partir d’images satellite. Elles sont ensuite vérifiées puis améliorées manuellement. La production et la diffusion de ces couches haute résolution sont pilotées par l'Agence européenne pour l'environnement. Pour la France, le Service de l'observation et des statistiques du ministère chargé de l'environnement a la responsabilité des vérifications et des améliorations de ces produits. Le taux d’imperméabilisation des sols cartographie le pourcentage des sols imperméabilisés par pixels de 20 m de côté. Le revêtement des sols imperméabilisés, issu de l’artificialisation des terres, est maintenu en général sur de longues périodes. La surface minimale cartographiée est de 20 m x 20 m. Les valeurs cartographiées sont : - 0 : Zone non-imperméable - 1-100 : Taux d'imperméabilisation - 254 : Inclassable (nuage, donnée satellite indisponible, ombre ou neige) - 255 : En dehors de la zone d'étude Ces données haute résolution peuvent être utilisées indépendamment ou en complément de CORINE Land Cover. En effet, CLC permet de cartographier des polygones homogènes d’occupation des sols tels que du tissu urbain discontinu et des zones industrielles ou commerciales. Les couches haute résolution permettent alors d’apporter une nouvelle information pour chacune de ces zones, en précisant leur degré d’imperméabilisation, leur taux de couvert arboré, etc.</ows:Abstract>

<ows:Title>Raster CORINE Land Cover - Couche haute résolution des zones humides et surfaces en eaux permanentes - Résolution 20m - 2012</ows:Title>
<ows:Abstract>Les couches haute résolution sont des couches thématiques d’occupation des sols, produites par le service Territoire du programme européen d'observation de la Terre Copernicus. Ce programme est coordonné par la Commission européenne et associe l’Agence spatiale européenne, l’Agence européenne pour l’environnement ainsi que les États membres. Ces données sont produites automatiquement à partir d’images satellite. Elles sont ensuite vérifiées puis améliorées manuellement. La production et la diffusion de ces couches haute résolution sont pilotées par l'Agence européenne pour l'environnement. Pour la France, le Service de l'observation et des statistiques du ministère chargé de l'environnement a la responsabilité des vérifications et des améliorations de ces produits. Les zones humides et surfaces en eaux permanentes cartographient la présence ou non de surfaces en eau permanentes et la présence ou non de zones humides. Ces surfaces sont identifiées à partir d’analyses d’images satellite prises à différentes saisons (de 4 à 5 images en moyenne) et différentes années. Sont ainsi cartographiées les surfaces en eau sur plusieurs dates de l’analyse. Les zones humides sont définies comme étant les zones où l'eau est le premier facteur d'influence de l'environnement et de la faune et de la flore associées. Elles surviennent là où la nappe phréatique affleure ou est proche de la surface du sol, ou quand la terre est recouverte d'une faible épaisseur d'eau. Les zones cartographiées sont recouvertes d'eau au moins une fois l'une des années observées ou présentent une humidité importante et constante. Elles sont situées dans des zones où la pente est inférieure à 10 %. Enfin, les zones cartographiées sont majoritairement couvertes d’hydrophytes ou de macrophytes. La surface minimale cartographiée est de 0,16 ha, ce qui correspond à un groupement de 4 pixels. Les valeurs cartographiées sont : - 0 : Zone non-humide - 1 : Surface en eau permanente - 2 : Surface en eau temporaire - 3 : Zone humide permanente - 4 : Zone humide temporaire - 254 : Inclassable (nuage, donnée satellite indisponible, ombre ou neige) - 255 : En dehors de la zone d'étude Ces données haute résolution peuvent être utilisées indépendamment ou en complément de CORINE Land Cover. En effet, CLC permet de cartographier des polygones homogènes d’occupation des sols tels que du tissu urbain discontinu et des zones industrielles ou commerciales. Les couches haute résolution permettent alors d’apporter une nouvelle information pour chacune de ces zones, en précisant leur degré d’imperméabilisation, leur taux de couvert arboré, etc. </ows:Abstract>

<ows:Title>Occupation du sol grande échelle - usage - ancienne génération</ows:Title>
<ows:Abstract>La composante Occupation du sol grande échelle retenue par l'IGN partitionne le territoire en deux vues, physionomique (la couverture) et fonctionnel (l'usage principal). La zone construite, calculée à partir de ces deux informations, délimite les espaces construits des espaces naturels, agricoles et forestiers. Les données respectent les préconisations nationales pour la production des bases de données d'occupation des sols à grande échelle (CNIG).</ows:Abstract>

<ows:Title>Photographies aériennes historiques 1950-1965</ows:Title>
<ows:Abstract>Couverture en photographies aériennes de la France des années 50, telle qu'elle se présentait avant les grands aménagements des années 60. Cette couverture a été réalisée à partir des photographies aériennes historiques numérisées par l'IGN. Elle est disponible sur la France métropolitaine, les départements et régions d'Outre-Mer (la Guyane n'est que partiellement couverte) et les collectivités d'Outre-Mer sauf la Polynésie française. Les photographies sont orthorectifiées, c'est-à-dire corrigées des déformations dues à la prise de vue et au relief du terrain, et assemblées pour fournir une visualisation continue superposable avec le Référentiel à Grande Echelle (RGE®) ou les cartes.</ows:Abstract>

<ows:Title>Ortho-express IRC 2026</ows:Title>
<ows:Abstract>L’Ortho Express est une mosaïque d’ortho-images numériques. Elle se différencie des autres produits orthophotographiques de l’IGN par le fait que, par souci de minimiser les délais de sa production, elle résulte d’un traitement massivement automatisé . L’Ortho Express vise en premier lieu à répondre à une exigence sur les délais de production. Il s’agit donc d’un produit dont les caractéristiques techniques sont contraintes par cette exigence forte ; édition 2026</ows:Abstract>

<ows:Title>Ortho-express RVB 2026</ows:Title>
<ows:Abstract>L’Ortho Express est une mosaïque d’ortho-images numériques. Elle se différencie des autres produits orthophotographiques de l’IGN par le fait que, par souci de minimiser les délais de sa production, elle résulte d’un traitement massivement automatisé . L’Ortho Express vise en premier lieu à répondre à une exigence sur les délais de production. Il s’agit donc d’un produit dont les caractéristiques techniques sont contraintes par cette exigence forte ; édition 2026</ows:Abstract>

<ows:Title>Spot 5</ows:Title>
<ows:Abstract>Cette couche est formée d'images prises par le satellite SPOT 5 en 2009 et 2010 depuis une altitude de 800 km. La résolution des images initiales est de 2,5 mètres/pixel, ce qui permet d'identifier l'existence de bâtiments, routes et chemins, et sa précision est homogène avec celle du référentiel à Grande Echelle. Le satellite SPOT 5 est exploité depuis 2002 par le Centre national d'études spatiales (CNES) et les images sont distribuées par la société Spot Image (Astrium GEO-Information Services). L'expertise de l'IGN menée à la demande du CNES a permis d'affiner les performances géométriques du capteur SPOT5, dans l'intérêt de tous les utilisateurs. La couche " SPOT 5 " visible sur Géoportail est issue de la co-édition Reference3D® entre Spot Image et l'IGN. Aucune légende n'est associée à cette couche. La radiométrie des images est traitée par des couleurs naturelles.</ows:Abstract>

<ows:Title>SPOT 5 sud-ouest 2009-2010</ows:Title>
<ows:Abstract>Cette couche est formée d'images prises par le satellite SPOT 5 en 2009 et 2010 depuis une altitude de 800 km. La résolution des images initiales est de 2,5 mètres/pixel, ce qui permet d'identifier l'existence de bâtiments, routes et chemins, et sa précision est homogène avec celle du référentiel à Grande Echelle. Le satellite SPOT 5 est exploité depuis 2002 par le Centre national d'études spatiales (CNES) et les images sont distribuées par la société Spot Image (Astrium GEO-Information Services). L'expertise de l'IGN menée à la demande du CNES a permis d'affiner les performances géométriques du capteur SPOT5, dans l'intérêt de tous les utilisateurs. La couche " SPOT 5 " visible sur Géoportail est issue de la co-édition Reference3D® entre Spot Image et l'IGN. Aucune légende n'est associée à cette couche. La radiométrie des images est traitée par des couleurs naturelles.</ows:Abstract>

<ows:Title>Restrictions UAS catégorie Ouverte et Aéromodélisme</ows:Title>
<ows:Abstract>Représentation des zones soumises à interdictions ou à restrictions pour l’usage, à titre de loisir, d’aéronefs télépilotés (ou drones), sur le territoire métropolitain, en Guyane, aux Antilles françaises, Saint-Pierre et Miquelon, Mayotte, La Réunion et aux Terres Australes, édition Juin 2026. Elle intègre partiellement les interdictions s'appuyant sur des données non publiées à l'AIP et ne couvre pas les interdictions temporaires. Cette carte est basée sur l’arrêté « espace » du 09/11/2017. La représentation des zones soumises à interdictions ou à restrictions n’engage pas la responsabilité des producteurs de la donnée. Le contour des agglomérations est fourni à titre purement indicatif. Consultez les interdictions temporaires sur https://www.sia.aviation-civile.gouv.fr/.</ows:Abstract>
